Process & Decision Documentation

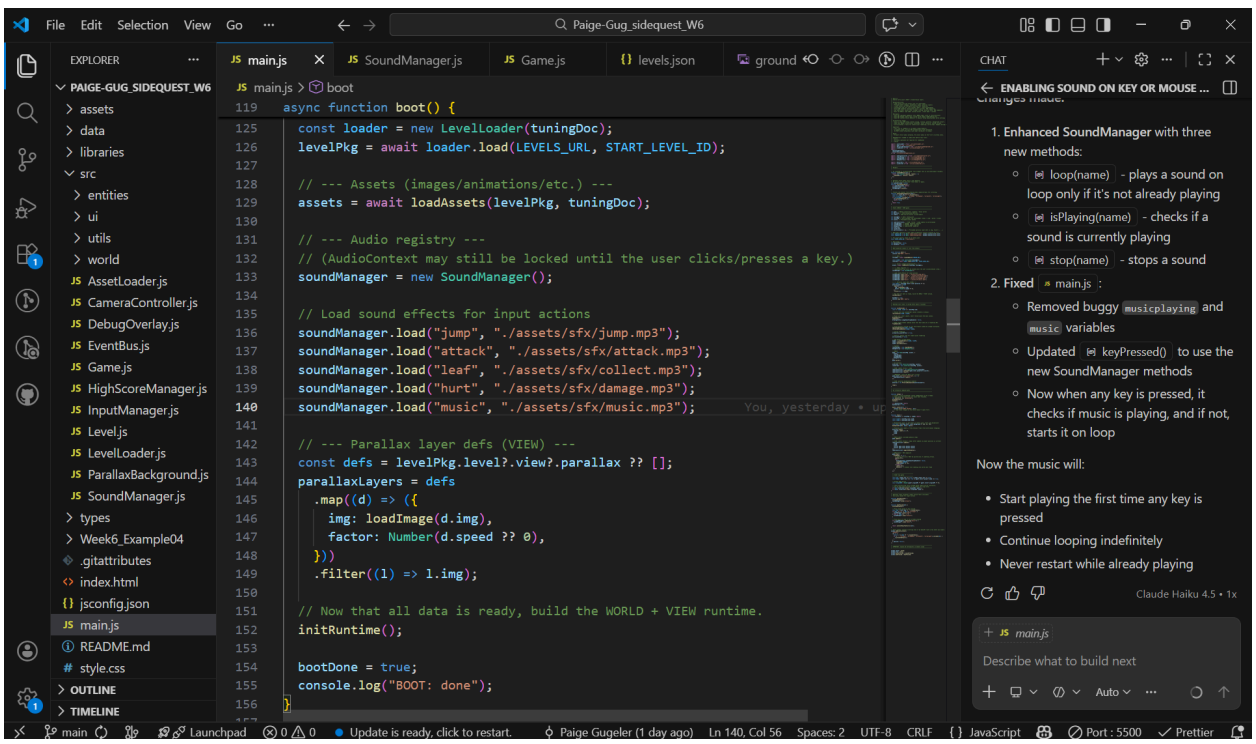
Role-Based Process Evidence

Goal of Work Session

The goal of this work session was to change the look and sound of the level. I chose a forest theme and selected visuals and audio to match.

Tools, Resources, or Inputs Used:

- Example 5 code from GBDA 302 Learn
- Visual Studio Code built-in GenAI - Claude Haiku 4.5



GenAI Documentation

Date Used: March 7, 2026

Tool Disclosure: Claude Haiku 4.5

Purpose of Use: I used GenAI to add sound to the game.

Summary of Interaction: I prompted GenAI to fix the code so that the sound effects would play on key presses and loop the backing music if it wasn't already playing.

Human Decision Point(s): I chose the sound effects and music according to how I wanted the game to feel, then asked GenAI to help implement them.

Integrity & Verification Note: I checked over the code using my own knowledge of code, as well as tested the output to ensure it played the sounds continuously.

Scope of GenAI Use: GenAI helped me fix the existing code so that the sounds would play continuously.

Limitations or Misfires: GenAI did not get the music to work after the first prompt I gave it so I had to add the music in myself and then get it to adjust my code so that it would play the music again after the song ends. It still doesn't play continuously, only if keys are pressed.

Summary of Process (Human + Tool)

1. Uploaded the Example 5 code
2. Downloaded tilesets and sprites from online
3. Changed the background and characters in the game
4. Downloaded music and sound effects from online
5. Uploaded the sound files
6. Asked AI to implement code for the sound effects
7. Coded the background music in myself
8. Asked AI to make the background music play continuously

Appendix

Prompt: make the sound work when a key or mouse is pressed

I'll help you add sound effects when keys or mouse buttons are pressed. Let me first explore the current code structure to understand how input and sound are managed.

Now I understand the structure. I'll make sound play when keys or mouse buttons are pressed. The system needs to:

Load sound files during boot

Play sounds in the input callbacks

Let me update the code:

Perfect! I've made sound work when keys and mouse buttons are pressed. Here's what I did:

Changes Made:

Loaded sound files during boot - In the boot() function, I added code to load all available sound effects:

jump.wav → "jump"

hitEnemy.wav → "attack" and "hit"

leafCollect.wav → "leaf"

receiveDamage.wav → "hurt"

Added sound playback to input callbacks:

Mouse click → plays "attack" sound

Jump key (W or Up Arrow) → plays "jump" sound

Attack key (Space) → plays "attack" sound

Now when you:

Click the mouse → attack sound plays

Press W or Up Arrow (jump) → jump sound plays

Press Space (attack) → attack sound plays

The audio system is unlocked on the first input, so sounds should work immediately after your first interaction.

Prompt: play the music when the player hits a key if it is not already playing

I'll fix the music looping logic. The current code has issues - music is set to a string instead of the actual sound object, so onended won't work. Let me update the SoundManager to support looping and fix the keyPressed handler.

Done! I've fixed the music looping system:

Changes made:

Enhanced SoundManager with three new methods:

loop(name) - plays a sound on loop only if it's not already playing

isPlaying(name) - checks if a sound is currently playing

stop(name) - stops a sound

Fixed main.js:

Removed buggy musicplaying and music variables

Updated keyPressed() to use the new SoundManager methods

Now when any key is pressed, it checks if music is playing, and if not, starts it on loop

Now the music will:

Start playing the first time any key is pressed

Continue looping indefinitely

Never restart while already playing
